| PROFESSIONAL SUMMARY

I am a Lead Quality Engineer with extensive experience designing, building, and scaling automated testing across web, API, and mobile platforms. Product, startup, and enterprise environments have all put me in charge of automation frameworks, API-first test strategies, and the integration of testing into CI/CD pipelines. My focus is improving quality practices across cross-functional engineering teams. Playwright, Cypress, Appium, WebdriverIO, TypeScript, and Java are all hands-on for me, and recent roles have had me leading testers, mentoring teams, and driving automation maturity.

| CORE TECHNICAL SKILLS

Quality Engineering & Testing

Test Automation, End-to-End Testing, UI Testing, API Testing, Mobile Testing, Regression Testing, Performance Testing, Test Strategy, Automation Framework Design, CI/CD Test Integration, Contract Testing, Release Validation, Developer Enablement, AI-Enabled Testing

Automation Tools

Playwright, Cypress, Appium, WebdriverIO, Selenium WebDriver, Cucumber, REST Assured, Supertest, Pact, Postman, SOAP UI, TestNG, JUnit, Swagger/OpenAPI, Grafana k6, Gatling

AI-Assisted Engineering

Claude Code, LLM-driven agents, MCP servers, agent skills and hooks, AI-assisted test authoring and code review, prompt and context design, secure-use guardrails for sensitive data

Languages & Frameworks

TypeScript, JavaScript, Java, Node.js, Scala, SQL

CI/CD & DevOps

Bitbucket Pipelines, AWS CodeBuild, GitHub Actions, GitLab CI/CD, Jenkins, Groovy, Terraform, Ansible, Kubernetes, Docker, chezmoi

Cloud, Data & Integration

AWS, AWS CLI, AWS SDK, EC2, Lambda, API Gateway, AppConfig, Google Cloud Platform, Cloudflare (Pages, R2, DNS), Proxmox, Prisma, MongoDB, Mongoose, MySQL, PostgreSQL, Kafka, AMQ, MQTT, Firebase

Operating Systems & Tooling

Unix/Linux (10+ years daily-driver desktop, terminal-native), Bash/Zsh, shell scripting

Collaboration & Project Tools

Jira, Confluence, Git, Agile/Scrum

| PROFESSIONAL EXPERIENCE

Sony Interactive Entertainment

Lead Quality Engineer

October 2022 – June 2026 | Remote, Brisbane

- I built and owned a centralised end-to-end automation framework in Bitbucket using TypeScript, Playwright, Appium, WebdriverIO, and Grafana k6 to support testing across web, API, and mobile platforms.
- Standing up an API-first approach, I shifted validation away from brittle UI tests and into the API and service layers.
- Starting from no coverage at all, I took automated end-to-end testing to 11 repositories across web, mobile, and API services.
- I structured coverage by microservice, with dedicated suites integrated into Bitbucket Pipelines to execute automatically on deployment.
- I dispatched test runs from Bitbucket Pipelines to AWS CodeBuild so suites ran inside the VPC with direct access to the MySQL and MongoDB instances for data setup.

- On each release, I validated configuration changes and confirmed automation outcomes as work progressed from development through QA and into production.
- With that coverage in place, I brought release progression down from days to hours.
- I led a QE capability of 3 testers, including 2 offshore QA engineers in Vietnam, while remaining hands-on within an embedded delivery squad.
- Day to day, I mentored junior testers, reviewed pull requests, and helped developers troubleshoot across services and infrastructure.
- I drove developer adoption of the automation framework far enough that developers ran suites independently and opened pull requests against the test code.
- Across every service, I worked as a full-stack tester and became the cross-service subject matter expert for testing and debugging.
- I ran working sessions with developers on testing and debugging techniques.
- As owner of the automation engineering standards, I published the coding and naming conventions in Confluence and enforced them in CI with ESLint, Prettier, strict TypeScript type checking, git hooks, and SonarCloud duplication checks.
- Leading the Cypress to Playwright migration, I split UI concerns from API concerns and cut a full regression run from around 45 minutes to under 5 minutes, so regression ran on every DEV and QA deployment.
- For API coverage, I rebuilt the suites service by service across challenge, team, user-service, payment, product-catalogue, and tournament, wiring each into its own deployment pipeline.
- To cut our dependency on live partner test accounts, I built a mock of a third-party publisher's game result API, which also opened up load testing of tournament close-out.
- On the performance side, I wrote Grafana k6 scenarios for game result scoring and for closing tournaments at scale, then set throughput and latency baselines and alert thresholds from what the runs showed.
- After auditing the manual regression checklist, I scoped the route to automated coverage in a dedicated Jira epic and wrote a quality definition of done so the squad shared ownership of release readiness.
- Ownership of the testing strategy document sat with me, and I revised it to match the tooling, test ownership model, and quality objectives the team worked to.
- Alongside the platform work, I delivered quality for the paid entry launch, Battlefield 6 tournaments, lobby tournaments, and head-to-head challenges.

Entain Australia

Lead Quality Engineer

March 2022 – October 2022 | Remote, Brisbane

- I introduced and built a Cypress-based end-to-end regression suite embedded directly within the UI codebase for a Vue-based application.
- Happy-path coverage and API stubbing formed the core of my approach, letting me validate standard user flows without a backend dependency.
- To tighten developer feedback loops, I made the application and test suite runnable locally without a live backend.
- Regression testing went into GitLab pipelines, so coverage ran automatically on deployment.
- I added LCOV reporting for visibility of test coverage.
- Expanding automated coverage across core application journeys cut manual regression effort.
- Parallel test execution brought the suite under 5 minutes.
- I raised release confidence by embedding automated validation directly into the delivery workflow.
- Alongside that, I promoted shift-left testing practices and pushed for stronger developer-owned unit test coverage across the Go APIs.
- Cypress, Playwright, and Selenium all went through my evaluation before I recommended the framework approach the wider team adopted.
- I mentored junior BAs and testers, bringing manual testers into automation practices.

Aurizon

Lead Quality Engineer

June 2021 – March 2022 | Hybrid, Brisbane

- I led quality engineering for a greenfield programme with 3 testers in a fast-changing delivery environment.
- With backend readiness incomplete, my pragmatic automation approach kept testing moving.
- I built a Cypress-based regression suite that mocked the unavailable backend APIs, giving reliable frontend regression coverage.
- Aligning automation with a frontend-first delivery model let me keep validating Jira acceptance criteria.
- I started migrating the existing WebdriverIO-based frameworks to Cypress to improve maintainability.
- Supertest and Joi gave me API schema validation and stronger service-level quality checks.
- I added consumer-driven contract testing with Pact to improve confidence in integrations.
- Regression testing ran in a CI workflow through GitHub Actions and Jenkins.
- The environment was Kubernetes-hosted, so I used cluster access and log tailing to troubleshoot issues.

CitrusAd

Quality Engineer

July 2020 – May 2021 | Hybrid, Brisbane

- I joined an early-stage startup with no established QA function and helped build automated testing capability.
- For the automation framework, I contributed across design and development in Selenium, Java, and REST Assured.
- SOAP UI covered SOAP service validation, with TestNG/JUnit handling test execution.
- I built end-to-end automated test flows that combined PostgreSQL data setup, API-driven workflow execution, and Selenium-based UI validation.
- The environment was Kubernetes-hosted, and I adapted test execution processes to operate effectively in it.
- No deployment automation existed, so I provisioned and configured test environments by hand using Terraform.
- I established an initial on-prem Jenkins solution to schedule and run automated regression suites.
- Later came Jenkins on Google Cloud, with test pipelines I codified in Groovy.
- Basic performance testing capability came in through Gatling.

Repeat.gg

Quality Engineer (Contract)

April 2020 – May 2020 | Remote, Brisbane

- My brief on a 4-week contract was to define an initial test strategy and implement an automation framework.
- I introduced Cypress into the existing development project to establish a foundation for automated testing.
- Initial functional and regression coverage went across the key application workflows.
- I backfilled automated tests into the codebase to improve baseline test coverage.
- On the CI/CD side, I advised on Cypress integration.
- The contract closed with a structured handover of the framework and test approach to the development team.

Flight Centre

Quality Engineer

March 2018 – March 2020 | Brisbane

- I supported 3 Agile delivery streams across the SOAR booking engine, building and maintaining UI regression coverage using Selenium, Java, REST Assured, and Cucumber BDD.
- SOAP UI handled SOAP-based service testing, and TestNG/JUnit ran the automated test execution.
- Overnight regression runs came to me for review, failure investigation, defect raising, and test maintenance across multiple brands.
- CI ran on Jenkins.

Ministry of Business, Innovation and Employment

Senior Test Analyst | Automation Tester

March 2016 – March 2018 | Auckland, New Zealand

- I built end-to-end UI automation using Selenium WebDriver and Cucumber across government registry platforms.
- SOAP service testing ran through SOAP UI, with TestNG/JUnit for automated test execution.
- Coordination of test activities put me alongside vendors and project managers.
- This role took me from manual testing into automation engineering, and I established early Selenium capability for the team.

Clearpoint – Global Dairy Trade (GDT)

Senior Test Analyst

September 2015 – March 2016 | Auckland, New Zealand

- I coordinated test activities across multiple agile workstreams, including a live auction platform and online marketplace.
- UAT planning, system handover, and release coordination all sat with me.

Ministry of Business, Innovation and Employment

Test Analyst | Application Support (Contract)

June 2012 – September 2015 | Auckland, New Zealand

- I progressed from application support into a dedicated testing role, supporting UAT and system integration testing across government registry platforms.
- External vendors worked with me on fix validation, database changes, and release activities.

| PERSONAL PROJECTS

Built With AI

I designed and built eleven personal repositories using LLM agents to handle the typing while I set the direction and reviewed the output.

- **Homelab infrastructure** — Terraform provisioning Cloudflare, Proxmox, and UniFi, with Ansible configuring the guests.
- **Home Assistant and Frigate NVR as code** — tracked YAML for Home Assistant, plus a detect-only Frigate layer running on a Coral TPU.
- **Dotfiles** — chezmoi-deployed Arch configuration across two hosts, with secrets pulled from a self-hosted Vaultwarden.
- **Reward flight finder** — a scheduled queue crawling a GraphQL API into a cache, with the frontend serving from that cache.
- **Personal site and content pipeline** — Astro, Tailwind, and Cloudflare Pages, with Zod validating YAML at build time.

AI-Enabled Testing

- I built and ran AI-assisted testing workflows across multiple personal repositories.
- Much of that work went into practical, secure use of AI tooling for test authoring and code review.

| CERTIFICATIONS & TRAINING

- IANZ Accreditation – Testing & Calibration Laboratories, 2010

| EARLIER CAREER

Teltherm Instruments — Team Leader (October 2008 – March 2012, Auckland NZ)

I led a team of 6 workshop staff, coordinating workload, staff training, manufacturing issue resolution, and instrumentation QA.

SM Gauge Company Limited — Instrument Technician (1997 – 2008, Bristol, UK)

I handled calibration, QA, welding, apprentice supervision, and basic IT support.
